**Introduction**

Respiratory disease is the third biggest killer in the UK after heart disease and cancer; 1 in 50 adults has COPD and 1 in 14 has asthma. Although there is increasing evidence that using data can drive improvements in quality of care and outcome, and there is a lot of data available for respiratory disease, it is not readily drawn into one place.

INHALE is the first single source of shared, accessible, actionable data on respiratory disease. It shows clinical variation, trends in disease patterns and quality of care, drawing on a wide range of relevant datasets for COPD and asthma which are available from the NHS and elsewhere.

The information presented in these profiles is also available as an interactive atlas which can be accessed from the homepage (click 'home' at the top of the page)

**Benchmarking**

The CCG is benchmarked against the national figure, the Commissioning Board Region and the Office for National Statistics (ONS) Clusters. ONS Clusters for CCGs are derived from LA data by Yorkshire and Humber PHO. Source: Spend and Outcomes Tool (SPOT).

NHS North Lincolnshire CCG lies within North of England Commissioning Region and is classified as a member of the 'ONS Cluster: Manufacturing Towns'.

**Key messages**

- In NHS North Lincolnshire CCG there were 3,168 people recorded as having COPD on the GP register.

- The recorded prevalence of COPD as a proportion of the total number of people with COPD in NHS North Lincolnshire CCG is 1.9%. This is lower than the average for the ONS Cluster: Manufacturing Towns, and lower than North of England Commissioning Region average.

- The reported prevalence in NHS North Lincolnshire CCG is significantly worse than the England average of 1.7%.

- The recorded prevalence of COPD as a proportion of the estimated prevalence of COPD is 0.68. This is lower than the ONS Cluster: Manufacturing Towns and higher than the North of England Commissioning Region average.

- In comparison with England, the ratio of reported/expected prevalence of COPD is higher than the England average.

- In NHS North Lincolnshire CCG, the under 75 mortality rate from respiratory disease is 36.1 per 100,000.

- In 2011, there were 64 deaths in Under 75s as a result of respiratory disease.

- In NHS North Lincolnshire CCG, 21.0% of patients were re-admitted in an emergency within 30 days of discharge of a COPD admission. This is lower than the Cluster average of 22.1% and lower than the Commissioning Board Region (22.1%). NHS North Lincolnshire CCG has lower re-admissions than the England average of 21.2%.

**COPD Prevalence**

Prevalence is the frequency of existing cases of a condition or disease. A major source of prevalence estimates is the quality and outcomes framework (QOF) which provides data about the number of people with a range of problems including COPD and asthma. The prevalence of COPD is the number of people recorded on GP COPD registers as a percentage of the total number of people registered with practices. (For more detail see http://www.qof.ic.nhs.uk/).

The recorded prevalence of COPD varies from 1.7% to 14.7% between the GP practices with the lowest and highest prevalences. The prevalence of recorded COPD has been increasing – this is likely to be due to better recording and detection of cases rather
than a genuine increase.

In NHS North Lincolnshire CCG the prevalence of recorded COPD is:

**Compared to England:**
- significantly worse than the England average.
- ranked 137 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
- lower than the average for the North of England Commissioning Region.
- ranked 20 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
- lower than average for the ONS Cluster: Manufacturing Towns.
- ranked 7 out of 23 amongst peers within the ONS Cluster.

---

**Trends in Reported Prevalence of COPD % - NHS North Lincolnshire CCG**

The chart below shows current trends in the reported prevalence of COPD in NHS North Lincolnshire CCG in comparison with the ONS Cluster: Manufacturing Towns and the North of England Commissioning Region average.

---

**COPD Expected Prevalence**

There is considerable evidence that COPD is under-diagnosed and under-recorded. For this reason people have conducted studies to try and estimate the extent of under-diagnosis and developed statistical models which can be used to generate expected numbers of people with COPD based on population characteristics. Comparing the figures obtained in this way with the recorded
numbers of people with COPD based on population characteristics, comparing the figures obtained in this way with the recorded figures suggests that only about 60% of potential cases of COPD are actually diagnosed. Better case detection is important in encouraging smoking cessations, follow-up and appropriate treatment and immunisation.

The gap between recorded and expected prevalence is a measure of the degree of under-diagnosis of COPD.

![Recorded & Expected Prevalence of COPD %](image)

Source: Reported Prevalence: Information Centre. QOF. Estimated Prevalence: Eastern Region Public Health Observatory (ERPHO)

Late diagnosis of COPD

The chart below shows the reported prevalence of COPD as a proportion of the expected prevalence.

![Ratio of Reported/Expected prevalence of COPD %](image)

- The recorded prevalence of COPD as a proportion of the estimated prevalence of COPD is 0.68. This is lower than the ONS Cluster: Manufacturing Towns and higher than the North of England Commissioning Region average.
- In comparison with England, the ratio of reported/expected prevalence of COPD is higher than the England average.

Clinical management and achievement - QOF COPD indicators

In this section we look at the achievement against the following QOF COPD clinical indicators for NHS North Lincolnshire CCG, the ONS Cluster, Commissioning Board and England:

Definitions:
- COPD08: % of patients with COPD who have had influenza immunisation in the preceding 1 September to 31 March.
- COPD10: % of patients with COPD with a record of FEV1 in the preceding 15 months.
- COPD12: % of patients with COPD who have had smoking cessation by a healthcare professional including measurement of
• COPD13: % of patients with COPD who have had a review, undertaken by a healthcare professional, including an assessment of breathlessness using the MRC dyspnoea score in the preceding 15 months.

• COPD15: % of all patients with COPD diagnosed after 1 April 2011 in whom the diagnosis has been confirmed by post bronchodilator spirometry.

Note: The QOF indicators described in this profile do not include patients who are ‘excluded’ from the indicators in the denominator. Patients can be excluded from QOF if they are unsuitable or ineligible for the care described in an indicator.

Summary - QOF COPD clinical indicators

![Graph showing QOF COPD clinical indicators](image)

Source: The Information Centre. QOF

Influenza immunisation

In this section we look at the QOF indicator COPD08 which is the percentage of patients with COPD who have had influenza immunisation in the preceding 1 September to 31 March.

In NHS North Lincolnshire CCG the percentage of patients with COPD who have had influenza immunisation in the preceding 1 September to 31 March:

**Compared to England:**
- significantly worse than the England average.
- ranked 196 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
- lower than the average for the North of England Commissioning Region.
- ranked 60 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
- lower than average for the ONS Cluster: Manufacturing Towns.
- ranked 20 out of 23 amongst peers within the ONS Cluster.

FEV1 checks for patients with COPD

COPD is a progressive condition, which means it gets worse as time goes on. FEV1 checks for patients with COPD help with management of the disease. The QOF indicator COPD10 is the percentage of patients with COPD with a record of FEV1 in the preceding 15 months.

**Compared to England:**
- significantly worse than the England average.
- ranked 186 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
- lower than the average for the North of England Commissioning Region.
- ranked 60 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
- lower than average for the ONS Cluster: Manufacturing Towns.
- ranked 21 out of 23 amongst peers within the ONS Cluster.

**Assessment of COPD with MRC dyspnoea score**

Patients can be graded in terms of severity using the MRC dyspnoea score. This indicator measures the proportion of people who have a record of a score. Unfortunately QOF data does not publish the proportion of patients with different scores so we can’t tell if the severity of cases varies between areas. Scoring can help tailor treatment, identify more severe case for more active management.
Compared to England:
- not significantly different than the England average.
- ranked 88 of the 211 CCGs in England.

Compared to Commissioning Board Region:
- higher than the average for the North of England Commissioning Region.
- ranked 31 out of 68 CCGs within the Region.

Compared to Peers within ONS Cluster:
- higher than average for the ONS Cluster: Manufacturing Towns.
- ranked 10 out of 23 amongst peers within the ONS Cluster.

Diagnosis of COPD confirmed by spirometry

Although COPD is often diagnosed on clinical grounds, it can only be accurately diagnosed by measuring the function of the lungs using a technique known as spirometry. Using the QOF data we can see what proportion of patients have a confirmed diagnosis.

Compared to England:
- not significantly different than the England average.
- ranked 57 of the 211 CCGs in England.

Compared to Commissioning Board Region:
- higher than the average for the North of England Commissioning Region.
- ranked 15 out of 68 CCGs within the Region.

Compared to Peers within ONS Cluster:
- higher than average for the ONS Cluster: Manufacturing Towns.
- ranked 8 out of 23 amongst peers within the ONS Cluster.

Hospital admissions for COPD (per 100 patients on the COPD register)

This is a crude rate of the number of all admissions (day case and inpatient) for COPD, per 100 patients on the practice COPD register.

Similar to the admission rate per 1000 population, a relatively low admission rate per 100 patients on the COPD register can reflect effective management in primary or community care, the providers’ thresholds for admission and the levels of bed availability, and may suggest tighter criteria for referring patients for secondary care which could mean that there are some patients who should be admitted but are not. Unlike the admission rate per 1000 population, this indicator is less likely to be influenced by the asthma prevalence levels.

A high admission rate per 100 patients on the COPD register may reflect; less effective management in primary or community care, lower thresholds for admission by the provider, or a higher level of inappropriate referrals (some patients who are admitted may not have needed admission.)

In NHS North Lincolnshire CCG Hospital admissions for COPD (per 100 patients on the COPD register) are:

**Compared to England:**
- not significantly different than the England average.
- ranked 138 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
- lower than the average for the North of England Commissioning Region.
- ranked 36 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
- lower than average for the ONS Cluster: Manufacturing Towns.
- ranked 15 out of 23 amongst peers within the ONS Cluster.

</tbody>
</table>
COPD Hospital admissions per 1000 population

This is a crude rate of the number of all hospital admissions (day case and inpatient) for COPD, per 1000 population (based on the GP list data). A relatively low admission rate can reflect a lower level of asthma morbidity in the population, which may be related to socio-economic or demographic factors. It may also imply effective primary or community care management of the condition which reduces the risk of episodes requiring hospital admission. Admission rates may be affected by the providers’ thresholds for admission and bed availability. Finally, the referring organisation’s policy or practice in referring patients for COPD secondary care may mean that there are some patients who should be admitted but are not.

Similarly, a high admission rate may reflect: high levels of COPD morbidity, less effective management in primary or community care, lower thresholds for admission by the provider, or a higher level of inappropriate referrals (some patients who are admitted may not have needed admission.)

In NHS North Lincolnshire CCG Hospital admissions for COPD (per 1000 population) are:

**Compared to England:**
- significantly worse than the England average.
- ranked 168 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
- lower than the average for the North of England Commissioning Region.
- ranked 31 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
- lower than average for the ONS Cluster: Manufacturing Towns.
- ranked 15 out of 23 amongst peers within the ONS Cluster.

</tbody>
</table>

Emergency admissions for COPD (per 1000 population)

Emergency admission rates may be affected by the same factors as overall admission rates; the effectiveness of primary care management, provider thresholds for admission and bed availability. In the case of emergency admissions per 1000 population, the COPD prevalence in the population may be reflected in the admission rate, and in the case of emergency admissions per 100 patients on the register, the accuracy of the case register may affect the denominator and hence the rate.

Emergency admission rates may reflect the population in the area; people from lower socio-economic groups are at higher risk, as are very young people and older people. Unsurprisingly, they also reflect disease prevalence in the population. Location and ethnicity may also influence emergency asthma admissions; urban patients are more likely to be admitted for asthma than rural patients, and people living close to A&E departments also have higher rates of admission. South Asian and black patients have higher asthma admission rates than white patients. (Purdy, 2010, a href="http://www.kingsfund.org.uk/sites/files/kf/Avoiding-Hospital-Admissions-Sarah-Purdy-December2010.pdf")

In NHS North Lincolnshire CCG emergency admissions for COPD are:

**Compared to England:**
- significantly worse than the England average.
• ranked 169 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
• lower than the average for the North of England Commissioning Region.
• ranked 31 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
• higher than average for the ONS Cluster: Manufacturing Towns.
• ranked 16 out of 23 amongst peers within the ONS Cluster.

</tbody>
</table>

**Average cost per hospital admission related to COPD**

Average cost of admission may reflect the case mix in the area, with high costs possibly reflecting a complex case mix. However, admissions costs should be considered alongside the rate of admissions per 100 patients on the COPD register.

If costs are low and there is a relatively high rate of admissions, this may suggest a low threshold for admissions on the part of providers. Higher admissions with lower costs may also suggest a high rate of inappropriate referrals (patients are admitted who don’t really need to be). If costs are low and the rate of admissions is also low, this suggests good post discharge support and effective discharge planning.

In areas where the average cost of admissions is high and there is a relatively low rate of admissions, this may suggest a high threshold for admissions on the part of the provider, and a low level of inappropriate referrals (with the associated risk that some patients should be admitted but are not). If costs are high and admissions are high as well, this may suggest a lack of effective discharge support and planning. It may also reflect a lack of good primary care of COPD.

In NHS North Lincolnshire CCG the average cost per hospital admission related to COPD are:

**Compared to England:**
• higher than the England average.
• ranked 167 of the 211 CCGs in England.

**Compared to Commissioning Board Region:**
• higher than the average for the North of England Commissioning Region.
• ranked 58 out of 68 CCGs within the Region.

**Compared to Peers within ONS Cluster:**
• higher than average for the ONS Cluster: Manufacturing Towns.
• ranked 20 out of 23 amongst peers within the ONS Cluster.

Under 75 mortality rate from respiratory disease

Deaths under 75 are usually called premature. Respiratory disease is the third biggest cause of premature mortality after cancer and cardiovascular disease. Within respiratory disease deaths, COPD and pneumonia are the commonest causes.

In NHS North Lincolnshire CCG the under 75 mortality rate from respiratory disease is 36.1 per 100,000. This is higher than the national rate of 27.3 per 100,000.

In 2011, there were 64 deaths in Under 75s as a result of respiratory disease.

Under 75 mortality rate from respiratory disease DSR per 100,000, 2011

COPD readmissions

COPD patients are often admitted as emergency cases and about 20% are readmitted within 30 days of discharge following a
previous admission. This rate is rising and varies considerably between areas.

The chart below shows the percentage of patients re-admitted in an emergency within 30 days of discharge of a COPD admission.

In NHS North Lincolnshire CCG, 21.0% of patients were re-admitted in an emergency within 30 days of discharge of a COPD admission. This is lower than the Cluster average of 22.1% and lower than the Commissioning Board Region (22.1%). NHS North Lincolnshire CCG has lower re-admissions than the England average of 21.2%.

Source: East Midlands Quality Observatory (EMQO). Numerator: Number of patients re-admitted in an emergency within 30 days of discharge of a COPD admission. Denominator: Number of patients discharged after a COPD admission.
